VENUS822A GPS / GNSS Baseband Processor – Flash Version

FEATURES

- Support GPS, Beidou, QZSS, SBAS
- Support GPS, GLONASS, QZSS, SBAS
- Ultra fast signal acquisition and TTFF speed
- Perform 16 million time-frequency hypothesis testing per second
- Signal detection better than -165dBm
- Reacquisition sensitivity –157dBm
- Open sky hot start 1 second
- Open sky cold start 29 seconds
- Accuracy 2.5m CEP
- Multipath detection and suppression
- Jamming detection and mitigation
- Supports AGPS
- Tracking 15mA @ 3.3V
- 7mm x 7mm QFN56, RoHS compliant

The Venus822A is a high-performance GPS / GNSS baseband processor intended for GPS / Beidou or GPS / GLONASS applications. It contains all the baseband function required for GPS / Beidou and GPS / GLONASS signal acquisition, tracking, and navigation solution. The Venus822A is designed to allow easy integration of GPS / Beidou or GPS / GLONASS into application systems.

A dedicated massive-correlator signal parameter search engine enables rapid search of all available satellites and acquisition of very weak signals. An advanced track engine allows weak signal tracking and positioning in severe environments such as urban canyons and under deep foliage.

A complete low-cost high-performance GPS / Beidou or GPS / GLONASS receiver can be built with Venus822A, a compatible GPS / Beidou or GPS / GLONASS RF front-end, and a small number of external components.

FUNCTIONAL DESCRIPTION

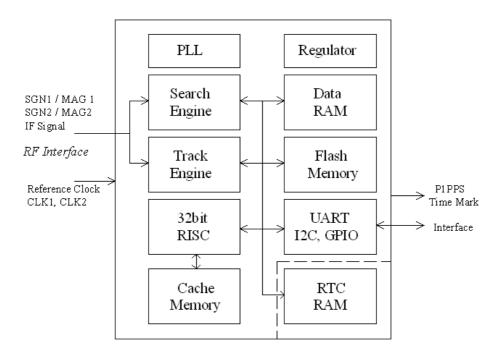

Figure-2 Baseband Processor Functional Diagram

The Venus822A implements all the needed function for GPS/Beidou and GPS/GLONASS signal acquisition, tracking, decoding, and navigation solution. It is optimized for GPS/Beidou or GPS/GLONASS applications requiring high performance. Major blocks within the chip are: GPS/GNSS signal processing engine, 32bit RISC processor, peripheral interface, and memory.

RF Interface

The RF interface supports single-ended IF signal in sign/magnitude format and sampling frequency of 16.367667MHz with +/-0.5ppm accuracy for GPS/Beidou, and 24.552MHz with +/-0.5ppm accuracy for GPS/GLONASS.

GPS/GNSS Signal Processing Engine

The signal-processing engine comprise of a signal parameter search engine and a track engine. Both implement carrier frequency wipe-off, pseudorandom code removal, plus coherent and incoherent integration required for indoors high-sensitivity signal processing.

The signal parameter search engine can be configured to search full code space and several frequencies simultaneously, or full code space of all satellites simultaneously. Massive correlator design allows extremely high signal acquisitions speed and high sensitivity performance.

32bit RISC

The internal 32bit RISC is a 7-stage pipelined processor. The processor handles all time-critical GPS/GNSS related functions, management controls, and navigation solutions.

Cache Memory

Cache memory subsystem consists of 16Kbyte I-cache, and 2Kbyte D-cache.

Battery-Backed RTC and RAM

The real-time clock circuitry and a small block of SRAM is included on-chip to retain time and the necessary GPS/GNSS data for rapid warm start and hot-start operation.

Data RAM

The chip contains SRAM needed for stand-alone operation. The on-chip SRAM is designed for low-power and high-speed single cycle access.

Program ROM

The chip implements program ROM on-chip.

UART

2 sets of UART is supported for Venus822A in QFN56 package.

I2C

1 set of I2C is supported for Venus822A in QFN56 package.

SPI

SPI with 2 chip-select is supported for Venus822A in QFN56 package.

Regulator

3.3V to 1.2V LDO regulator and 3.3V to 1.2V DC/DC switching regulator is implemented on-chip for powering the RTC & Backup SRAM region (V12I_RTC) and the core logic (V12I).

PLL

The signal parameter search engine requires a high frequency clock. It is generated from the GPS reference clock through the on-chip PLL. A divided-down PLL clock is selected to clock the 32bit RISC.

POWER SUPPLIES

The system is partitioned into the following power supply domains:

VDDIO: Digital supply voltage for the I/O interface, supporting 3.3V I/O, 2.97V ~ 3.63V.

V12I: 1.08V ~ 1.32V, the main digital supply voltage for the core logic. It is typically derived from the on-chip 1.2V DC/DC switching regulator or can be provided from an external supply source.

V12I_PLL: 1.08V ~ 1.32V, the analog supply voltage for the internal PLL.

V12I_RTC: 1.08V ~ 1.32V, the digital supply voltage for the battery backed-up RTC and SRAM. Current consumption ~7uA when main chip is inactive, ~1mA when main chip is active.

VDDIFINT: Digital supply voltage for RFIC interface pins (CLK / SGN / MAG), supporting 3.3V I/O or 1.8V I/O. 2.97V ~ 3.63V for 3.3V I/O. 1.62V ~ 1.98V for 1.8V I/O.
